Education

East West University Dhaka, BD
B.Sc. in Computer Science And Engineering — Hold CGPA: 3.67 on a scale of 4.00 *Jan 2018 – Jan 2022*

Experience

Senior Software Engineer June 2022 – Present
Enosis Solution BD *Dhaka, BD*

- Created and implemented real-time, event-driven solutions utilizing Python, Django, Radis, and Celery, which improved system responsiveness for an application handling 50,000 simultaneous users. This led to a 60% enhancement in user experience according to key engagement metrics.
- Optimized and revised database queries and structures, such as PostgreSQL, on an AWS RDS instance, resulting in a substantial reduction in system load and enhancing performance by more than 30%.
- Led the architectural transformation from a legacy monolithic system to a scalable microservices architecture using (FastApi, Docker, AWS EC2 AWS ECS), resulting in a 99.9% system uptime guarantee, a 35% reduction in average server load, and a 25% improvement in end-user request latency.
- Dramatically improved a client's Angular-based website by optimizing the initial load time of the web app, resulting in a Lighthouse performance score increase from 30 to over 90 and contributing to a 15% reduction in customer bounce rate
- Engineered an automated data reporting service (supporting Excel, CSV, PDF via Python) that eliminated manual data manipulation errors, providing the executive team with 100% reliable, real-time pricing data to inform competitive strategies
- Coached and mentored 3 junior developers and collaborated with cross-functional teams to streamline project workflows, resulting in a 20% reduction in time-to-market for new feature deliverables
- Executed a major version upgrade of the front-end Angular framework, leveraging modern features like Standalone Components, Component-based Routing, and Lazy-loaded Modules to boost initial component load time by 15% and reduce future technical debt by architecturally future-proofing the application

Projects

AsyncQ | *Python, Redis*

- Engineered a custom, high-throughput asynchronous task queue from scratch to decouple computationally expensive background jobs, reducing main thread latency by 90% across the primary application
- Implemented a robust producer/consumer model leveraging Python's asyncio for reliable, non-blocking task submission
- Designed and deployed intelligent task routing logic using Redis as the message broker, ensuring efficient resource allocation across different worker types.
- Developed distributed worker processes that demonstrated a capacity for concurrently processing over 500 tasks per second, establishing a highly scalable backend foundation
- Source: pypi/async-q

Markdown Editor | *Next.js, React*

- Developed robust file management and data integrity services including drag & drop upload, local state management, and multi-format export (PDF, Markdown) to ensure reliable document creation
- Delivered a professional user experience (UX) with features like syntax highlighting, word counts, and theme switching, demonstrating commitment to modern front-end standards.

Technical Skills

Languages: Python, SQL (Postgres), JavaScript/TypeScript, HTML/CSS
Frameworks:Django, FastAPI, Angular, Nextjs, Node.js, Flask, Material-UI
Developer Tools: Git, Git-Action ,Docker, TravisCI, VS Code, Cursor, Eclipse
Cloud/Platform Services: AWS(EC2, S3, Secret manager, ECS, SQS)
